COPERTURE DELFINESI-PROVENZALI

FYV

FLYSCH DI VENTIMIGLIA
Arenarie grossolane gradate e arenarie fini in banchi e strati con intercalazioni siltoso-arenacee e siltoso-argillose; presenti livelli argillo-marnosi e talora calcareo-marnosi.
BARTONIANO SUP-PRIABONIANO INF.

OSM

MARNE SILTOSE DI OLIVETTA S. MICHELE
Marne bluastre alternate a sottili strati di marne siltose beige, con sporadici livelli argillo-sabbiosi. Presenti subordinate intercalazioni calcareo- arenacee. Nella parte superiore dell'unità si osserva la presenza di materiale terrigeno arenaceo-siltitico.
LUTEZIANO SUP-BARTONIANO *(Zona a Truncorotaloides rohri – Zona a Globigerinatheka semiinvoluta)*

NCM

CALCARENITI DI CAPO MORTOLA
Arenarie biancastre alla base passanti a calcareniti in banchi massicci, in genere biodetritici, con locali orizzonti basali conglomeratici e con associazioni a macroforaminiferi di grosse dimensioni (fra i quali: Discocyclina, Gypsina, Nummulites, Orbitoïdites, Operculina) ed alghe calcaree localmente predominanti rispetto ai foraminiferi (fra le quali: Lithoporella, Lithotamnion). Nella parte alta della serie presenza di strati arenacco-siltosi a coralli isolati e foraminiferi (Morozovella cfr. aragonensis, Turborotalia cerroazulensis frontosa e dei generi Globigerinatheka ed Acarinina).
LUTEZIANO SUP-BARTONIANO INF. *(Associazione a Gypsina globula, Nummulites cf. brongniarti e Nummulites cf. perforatus)*

MIC

FORMAZIONE A MICROCODIUM
Marne grigie e rosse bioturbate e strutture da Microcodium passanti verso l'alto a conglomerati e brecce con clasti eterogenei, ai quali seguono marne e calcari micritici in strati sottili con noduli di selce nera.
PALEOCENE-LUTEZIANO SUP.?

TUC

MARNE E CALCARI MARNOSI DI TRUCCO
Calcari più o meno marnosi, in strati e banchi, con intercalazioni di marne più fitte e di maggior spessore nella parte superiore.
CAMPANIANO SUP.-MAASTRICHTIANO INF. *(Zona a Aspidolithus parcus parcus – Zona a Uniplanarius trifidus)*
